

Prisca 5.1.0.17
Date of report: 21/12/25

Patient data			
Name	Mrs. NUPUR RAJPUT		Patient ID
Birthday	01/03/02		Sample ID
Age at sample date	23.8		Sample Date
Gestational age	12 + 3		
Correction factors			
Fetuses	1	IVF	no
Weight	69	diabetes	no
Smoker	no	Origin	Asian
		Previous trisomy 21 pregnancies	unknown
Biochemical data		Ultrasound data	
Parameter	Value	Corr. MoM	Gestational age
PAPP-A	1.62 mIU/mL	0.50	12 + 3
fb-hCG	41.12 ng/mL	1.00	Method
			CRL Robinson
			Scan date
			20/12/25
			Crown rump length in mm
			61
			Nuchal translucency MoM
			1.26
			Nasal bone
			unknown
			Sonographer
			NA
			Qualifications in measuring NT
			Sonographer
Risks at sampling date			
Age risk		1:1003	
Biochemical T21 risk		1:1182	
Combined trisomy 21 risk		1:2268	
Trisomy 13/18 + NT		<1:10000	
Risk		Trisomy 21	
The graph shows a curve representing the risk of Trisomy 21 increasing with age. The risk at age 25 is approximately 1:2268, which is below the cut-off line.		The calculated risk for Trisomy 21 (with nuchal translucency) is below the cut off, which indicates a low risk. After the result of the Trisomy 21 test (with NT) it is expected that among 2268 women with the same data, there is one woman with a trisomy 21 pregnancy and 2267 women with not affected pregnancies. The calculated risk by PRISCA depends on the accuracy of the information provided by the referring physician. Please note that risk calculations are statistical approaches and have no diagnostic value! The patient combined risk presumes the NT measurement was done according to accepted guidelines (Prenat Diagn 18: 511-523 (1998)). The laboratory can not be hold responsible for their impact on the risk assessment ! Calculated risks have no diagnostic value!	
Trisomy 13/18 + NT			
The calculated risk for trisomy 13/18 (with nuchal translucency) is < 1:10000, which represents a low risk.
