First trimester: Pre Ultrasound Maternal age risk for Trisomy21 is 1 in 760

IMPRESSION:

- Live single gestation of average 12 weeks 4 days.
- Assigned EDD as per CRL is 30/07/2026.
- Nuchal translucency is 1.5 mm which is 25 percentile for the CRL.
- Pre Ultrasound Maternal age risk for Trisomy21 is 1 in 760
- Risk From History Plus NT, FHR for Trisomy 21 and Trisomy 13/18 are 1 in 4000 and 1 in 4500 respectively.
- Evaluation of maternal uterine Doppler shows normal proper placentation (mean PI- 1.35).

Advice - Anomaly scan around 20 weeks/ Double marker correlation.

I, DR.MAMTA VERMA declare that while conducting sonography on MRS. POONAM (name of pregnant woman), I have neither detected nor disclosed the sex of the fetus to anybody in any manner.

DR.MAMTA VERMA
MBBS, MD (Radiodiagnosis)
Consultant Radiologist

Please note that all anomalies can not be detected all the times due to various technical and circumstantial reasons like gestation period, fetal position, quantity of liquor etc. The present study can not completely confirm presence or absence of any or all the congenital anomalies in the fetus which may be detected on post natal period. Growth parameters mentioned herein are based on International Data and may vary from Indian standards. Date of delivery (at 40 weeks) is calculated as per the present sonographic growth of fetus and may not correspond with period of gestation by L.M.P. or by actual date of delivery. As with any other diagnostic modality, the present study should be correlated with clinical features for proper management. Except in cases of Fetal Demise or Missed Abortion, sonography at 20-22 weeks should always be advised for better fetal evaluation and also for base line study for future reference.

REQUEST FOR OBSTETRIC USG ON YOUR LETTER HEAD IS MANDATORY (PCPNDT ACT). PLEASE COMPLY.
