Risk		Trisomy 21	
The graph shows a risk curve that increases with age. A horizontal line at 1:8688 represents the 'Cut off'. The area above this line is red, the area between the line and the curve is yellow, and the area below the curve is green. A black vertical bar is positioned at age 25, reaching up to the 1:8688 risk level.		The calculated risk for Trisomy 21 (with nuchal translucency) is below the cut off, which indicates a low risk. After the result of the Trisomy 21 test (with NT) it is expected that among 8688 women with the same data, there is one woman with a trisomy 21 pregnancy and 8687 women with not affected pregnancies. The calculated risk by PRISCA depends on the accuracy of the information provided by the referring physician. Please note that risk calculations are statistical approaches and have no diagnostic value! The patient combined risk presumes the NT measurement was done according to accepted guidelines (Prenat Diagn 18: 511-523 (1998)). The laboratory can not be hold responsible for their impact on the risk assessment ! Calculated risks have no diagnostic value!	
Trisomy 13/18 + NT			
The calculated risk for trisomy 13/18 (with nuchal translucency) is < 1:10000, which represents a low risk.
